The Copper IUD

**Does it work?**
Yes. A copper IUD acts as a barrier to prevent sperm from reaching the egg.

**How long does it last?**
Copper IUDs can last up to 10 years. After that, you’ll need to get a new one.

**How does it work?**
Copper IUDs release copper over time, which makes it harder for sperm to travel through the uterus to fertilize an egg. Copper IUDs are especially effective in preventing pregnancy for the first month or two after insertion.

**Can it cause any harm?**
Copper IUDs are generally safe and effective. However, like any medical device, they can cause minor side effects. Some women may experience cramping, spotting, or輕度腹痛.

**How is it inserted?**
A copper IUD is inserted into the uterus by a healthcare provider. It typically takes about 5 minutes, and you can return to normal activities right after the procedure.

**Is it reversible?**
Yes. Once the copper IUD is removed, you can choose to continue using contraception or stop using contraception altogether.

**Who can use it?**
Copper IUDs are generally recommended for women who are not trying to get pregnant, have a history of PID or other sexually transmitted infections, or have had a tubal ligation.

**Can I get it free?**
Many women can get a copper IUD for free or at a low cost through local clinics or family planning organizations.

**How can I get more information?**
You can contact your healthcare provider or a local family planning clinic to learn more about copper IUDs and to see if they are right for you.

What Is A Copper IUD?
A Copper IUD is a small plastic device with copper wire wrapped around its stem. It is placed inside the uterus (womb) to prevent pregnancy. It has a fine nylon string attached to it. When the Copper IUD is in place, the string comes out through the cervix (the end of the uterus) into the vagina. The IUD can stay in place for five to ten years depending on the type.

How Does The Copper IUD Work?
The copper released from the IUD affects both the sperm and the eggs making it unlikely they will meet and the IUD causes changes in the lining of the womb making it less suitable for a pregnancy.

How Well Does It Work?
The Copper IUD works very well. It is more than 99% effective.

Who Can Use A Copper IUD?
Most women are able to use a copper IUD, including women who haven’t had a baby before, but talk to your doctor, as there are some reasons why it may not be right for you.

Who Should Not Use An IUD?
You should not use an IUD if you could be pregnant.

It may be better for women who have heavy periods to use a progestogen IUD. There are some medical conditions that you may have which could prevent you from using the Copper IUD. It is very important to talk with your doctor to be sure it is safe for you to use it.

Are There Any Side Effects?
Your periods may be heavier, longer and sometimes more painful with a copper IUD.

There is a small chance of getting a pelvic infection at the time of the copper IUD insertion.

The doctor or nurse will tell you about other risks of having the copper IUD inserted.

How Do You Get The Copper IUD?
You need to go to a doctor or Family Planning Clinic. Usually you are asked to make two visits. On the first visit the doctor asks questions about your health and tells you about the IUD. You will have a vaginal/pelvic examination and possibly a test for vaginal infection. On the second visit the IUD is inserted. The procedure takes about 10 minutes. Some women may find the experience a bit uncomfortable while others may find it somewhat painful. Some women can feel faint during or after the insertion and you will probably need to rest for a while before you leave the clinic.

You do not have to fast before the procedure, in fact it is a good idea to eat beforehand. You should allow at least an hour to be at the clinic.

How Is The Copper IUD Taken Out?
You need to go to a doctor or Family Planning Clinic to have it taken out. The doctor uses a special instrument to remove the IUD by gently pulling on the string. This only takes a couple of minutes. Some women find it a little uncomfortable but most women don’t feel much at all.

Things To Remember
Feel inside your vagina with your finger to check the string each month after your period, to be sure the IUD is in place.

If your period is more than a week overdue, you have a change in your usual bleeding pattern or you are
concerned that you could be pregnant, go to see your doctor or clinic for a pregnancy test.

If you have any unusual discharge from your vagina or pain low in your abdomen, see your doctor straight away.
